Fundamentals of Statistical Modeling (VT21)

Andrea Discacciati Karolinska Institutet Stockholm, Sweden

Lab 5

Load the dataset and the mlci command

- . version 14
- . use https://raw.githubusercontent.com/anddis/fsm/master/data/lab5_1.dta, clear
- . run https://raw.githubusercontent.com/anddis/fsm/master/do/mlci.do

Exercise 1

We consider again the oral cancer dataset (see Lab 4). We measure time to death (y) due to oral cancer (d = 1) (continuous line in the graphs) or to other causes (d = 2) (dashed line in the graphs). Just to get started, we exclude the censored observations (d = 0) from our estimation procedure (note the if d != 0 at the end of the mlexp command).

We model the joint distribution f(y, d) through the conditional expansion

$$f(y,d) = f(d|y)f(y).$$

We consider a log-normal distribution for f(y) and a bernoulli distribution for f(d|y). Estimate the model's parameters. Remember to constrain the bounded parameters. How do we interpret $\exp(\gamma_1)$?

```
. local G = (\log(y)-\{mu\})/\exp(\{theta\})
. local g = "(1/exp({theta})/y)"
. local eta = "invlogit({gamma0}+{gamma1}*y)"
. local f1 = "normalden(`G´)*`g´"
. local f2 = "`eta´^(d==1)*(1-`eta´)^(d==2)"
. mlexp (log(`f1'*`f2')) if d != 0
initial:

Exercise 3

We recruited 2,784 subjects in Sweden at the time of their first myocardial infarction. We took a blood sample and measured LDL cholesterol (mmol/L) on a first follow-up visit, 1 month after the MI (variable 1d11). We then measured LDL cholesterol again 6 months after the MI (second follow-up visit) (variable 1d12). Plot the sample histogram of the 2 variables. What can we say about them?

We model the marginal distributions of the 2 variables: $f(ldl_1)$, $f(ldl_2)$. We consider skew-normal models. This means that Z = G(Y) follows a standard skew-normal distribution.

$$G(y) = (y - \mu)/\sigma$$
$$g(y) = 1/\sigma$$
$$f_Z(z) = 2F_N(\alpha z)f_N(z)$$

where $F_N(z)$ and $f_N(z)$ are the standard normal CDF and PDF, respectively.

Estimate the 2 models' parameters and plot the densities over the sample histograms. Are the data suggesting that the skewness parameter α is different from 0?

```
. local G = (1dl1-\{mu\})/\exp(\{theta\})

Exercise 4

We consider the joint distribution of ldl_1 and ldl_2

```
f(ldl_1, ldl_2) = f(ldl_2|ldl_1) f(ldl_1)
```

We assume that $f(ldl_1)$ and $f(ldl_2|ldl_1)$ are skew-normal. Allow all parameters of $f(ldl_2|ldl_1)$ to depend on ldl_1 . Estimate the model's parameters. Remember to constrain the bounded parameters.

```
. local f1 = "normal({alpha1}*(ldl1-{beta1})/exp({theta1}))"

Draw a scatterplot of ldl_2 versus ldl_1 . Do the results above agree with the plot? Make a qualitative assessment.

Plot the estimated conditional denisity $\hat{f}(ldl_2|ldl_1)$ for ldl_1 values of 2, 3, and 5 mmol/L. Again, make a qualitative assessment of the plot.
